

## Squeeze theorem.

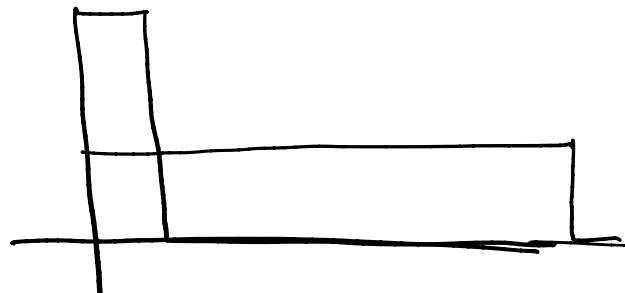

Theorem If  $a_n \leq b_n \leq c_n$  and  $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} c_n = L$

then  $\lim_{b_n \rightarrow \infty} = L$ .

Let  $b_n \rightarrow L$  and assume  $a_n \leq b_n \leq c_n$ . Is

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} c_n = L ?$$

Assume  $\int_a^b f(x) dx$  and  $\int_a^b g(x) dx$  converge and  
 $\int_a^b f(x) dx \leq \int_a^b g(x) dx$ . Is  $f(x) \leq g(x)$  for  
all  $x \in [a, b]$ .

## Squeeze theorem:

o Compute  $\lim_{n \rightarrow \infty} \frac{n!}{n^n}$

$$a_n \leq b_n \leq c_n$$

↓      ↓      ↓

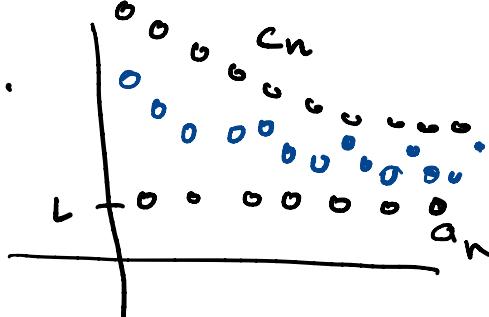

L      L      L

$$0 \leq \frac{n!}{n^n} = \frac{1 \cdot 2 \cdot 3 \cdots n}{n \cdot n \cdot n \cdots n} \leq \frac{1}{n} \cdot \underbrace{1 \cdot 1 \cdots 1}_{n-1} = \frac{1}{n} \downarrow 0$$

↓      ↓      ↓

0      0      0

- True or False: let  $a_n \leq b_n \leq c_n$  with  $a_n \rightarrow L$  and  $c_n \rightarrow L+1$ . Then  $\{b_n\}$  converges to a real number  $M$  that satisfy  $L \leq M \leq L+1$ .

Example

L

- Given that  $|a_n| \rightarrow 0$ , does  $\{a_n\}$  converge?

$$-|a_n| \leq a_n \leq |a_n|$$
$$\downarrow \quad \downarrow \quad \downarrow$$
$$0 \quad 0 \quad 0$$

## Sequences and continuous functions.

Theorem: If  $a_n \rightarrow L$  and  $f(x)$  is continuous at  $x=L$  then  $f(a_n) \rightarrow f(L)$ .

Example

(1) Calculate  $\lim_{n \rightarrow \infty} \sin\left(\frac{\pi n}{2n+1}\right)$

let  $a_n = \frac{\pi n}{2n+1}$  ..  $\lim_{n \rightarrow \infty} \frac{\pi n}{2n+1} = \lim_{n \rightarrow \infty} \frac{\pi}{2 + \frac{1}{n}}$

by theorem:

$$\sin\left(\frac{\pi n}{2n+1}\right) \rightarrow \sin\left(\frac{\pi}{2}\right) = \cancel{\frac{1}{2}}$$

$$r^n \rightarrow 0 \quad \text{if } |r| < 1.$$

$$= \frac{\lim_{n \rightarrow \infty} \pi}{\lim_{n \rightarrow \infty} \left(2 + \frac{1}{n}\right)} = \frac{\pi}{2}$$

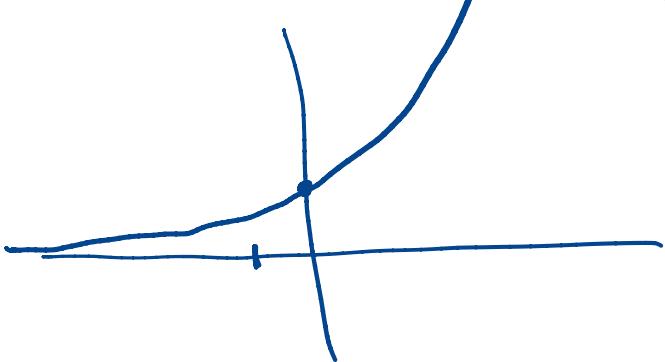

## Example

ii) Calculate

$$\lim_{n \rightarrow \infty}$$

$$e^{-\left(\frac{n^2+2}{n^2+1}\right)}$$

inner sequence

$$a_n = -\frac{n^2+2}{n^2+1}$$

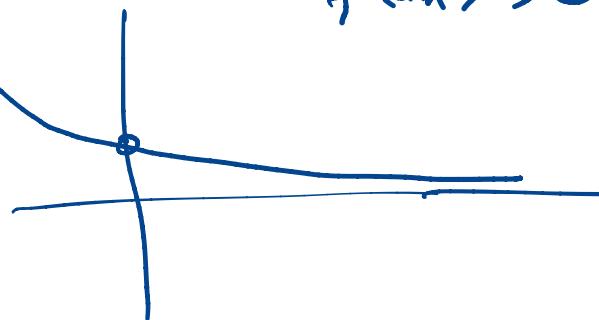

$$a_n = \frac{n^2+2}{n+1}$$

$$f(a_n) \rightarrow e^{-1}$$

$$\boxed{1 - f(x) = e^x}$$

$$1 - f(x) = e^{-x}$$

$$f(a_n) \rightarrow e^{-1}$$

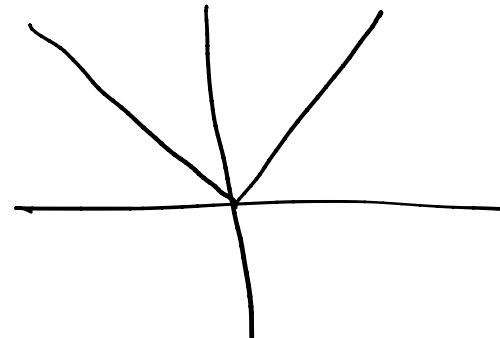

Example.

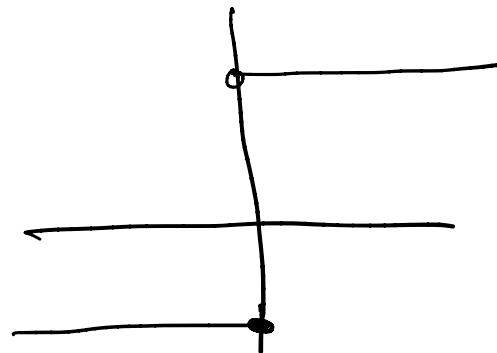

Let  $f(x) = |x|$ .

compute  $\lim_{n \rightarrow \infty} f' \left( \frac{n^2+1}{(n+1)(n^2+2)} \right)$

$$\frac{n^2+1}{(n+1)(n^2+2)} \approx \frac{n^2}{n^3} = \frac{1}{n} \rightarrow 0$$

$$f(x) = |x|$$

$$f'(x) = \begin{cases} -1 & \text{if } x < 0 \\ +1 & \text{if } x > 0 \end{cases}$$

## Exponential function.

$$\{r^n\}_{n=0}^{\infty} = \{1, r, r^2, r^3, \dots\}$$

This is a very useful lemma that we will use later in next lecture.

Lemma: The sequence  $a_n = r^n$  is convergent when  $-1 < r \leq 1$  and otherwise is divergent.

$$\lim_{n \rightarrow \infty} r^n = \begin{cases} 1 & r = 1 \\ 0 & |r| < 1 \\ \text{divergent} & \text{otherwise.} \end{cases}$$

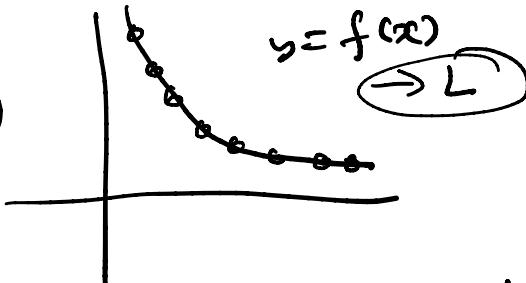

Recall:

Thm: If  $\lim_{x \rightarrow \infty} f(x) = L$  and  $a_n = f(n)$  for  $n = 1, 2, 3, \dots$

then  $\lim_{n \rightarrow \infty} a_n = L$ .

## Proof of Lemma.

- In the case  $r=1$ , obvious! ( $r^n=1$ )
- In the case  $|r| < 1$ . consider  $f(x) = r^x$ . Note that  $r^x \rightarrow 0$  as  $x \rightarrow \infty$  if  $-1 < r < 1$   
so, by using the theorem,  $r^n \rightarrow 0$  if  $|r| < 1$
- If  $|r| > 1$ .  $r^n = \underbrace{r \cdot r \cdots r}_{n\text{-times}} \rightarrow \infty$

## Bounded sequences.

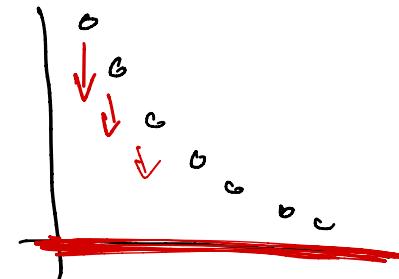

Sometimes it is useful to whether a sequence converges without computing the exact value.

consider the sequence  $a_n = \frac{1}{n+2}$ . Does  $\{a_n\}$  converge?

We know:

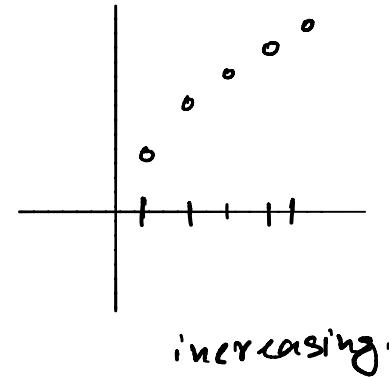

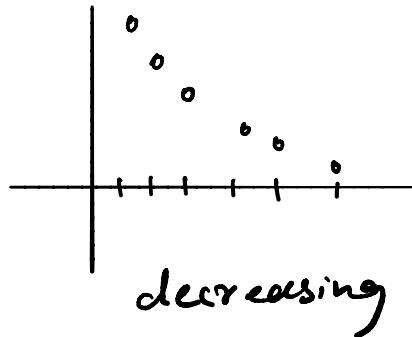

- $a_n > 0$  for all  $n$  - lower bounded.
- $a_{n+1} < a_n$  for all  $n$  - decreasing.

$$a_{n+1} - a_n = \frac{1}{n+3} - \frac{1}{n+2} = \frac{(n+2) - (n+3)}{(n+3)(n+2)} = \frac{-1}{(n+3)(n+2)} < 0$$

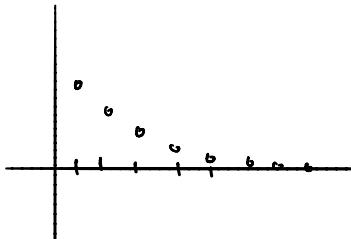

## Definition:

- A sequence  $\{a_n\}$  is decreasing if  $a_n \geq a_{n+1}$  for all  $n$ .
- A sequence  $\{a_n\}$  is increasing if  $a_n \leq a_{n+1}$  for all  $n$ .
- A sequence is monotonic if it is increasing or decreasing

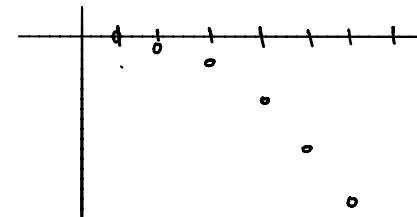

### Definition.

- A sequence  $\{a_n\}$  is bounded below if there is some number  $M$  s.t.  $a_n \geq M$  for all  $n \geq 1$ .
- A sequence  $\{a_n\}$  is bounded above if there is some number  $M$  s.t.  $a_n \leq M$  for all  $n \geq 1$ .
- A sequence is bounded if it is bounded below and above.

$$a_n = e^{-n}$$

bounded below

$$a_n = \ln\left(\frac{1}{n}\right)$$

unbounded below.

## Monotonic sequence theorem (Monotonic Convergence Theorem).

Thm Every bounded and monotonic sequence converges.

example :  $a_n = \frac{n}{n+1}$

$$a_n - a_{n+1} = \frac{n}{n+1} - \frac{n+1}{n+2} = \frac{n(n+2) - (n+1)^2}{(n+1)(n+2)}$$

$$\Rightarrow a_n \leq a_{n+1} \text{ (increasing).} \quad = \frac{n^2 + 2n - n^2 - 2n - 1}{(n+1)(n+2)} \leq 0$$

(1)

$$\Rightarrow 0 \leq a_n \leq 10 \quad \text{(bounded)}$$

$\Rightarrow \{a_n\}$  converges.

## Converse of MCT.

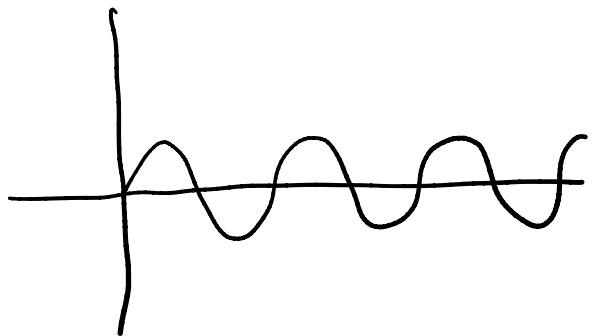

True / False: If a sequence is convergent then it is monotonic and bounded. False

Ex :  $a_n = \frac{\sin(n)}{n} \rightarrow \underline{\text{not monotonic}}$

$$-\frac{1}{n} \leq \frac{\sin(n)}{n} \leq \frac{1}{n}$$
$$\begin{matrix} \downarrow & & \downarrow \\ 0 & & 0 \\ \downarrow & & \downarrow \\ 0 & & 0 \end{matrix}$$

By squeeze theorem.

$\sin(x)$

$\frac{1}{x}$ ,  $-\frac{1}{x}$

$\frac{\sin x}{x}$
